	Band 3	#449782	Upper and lower

Volume profile

	Value area rows	#499C88	FRVP histogram

Position Tool: Neutral Scheme

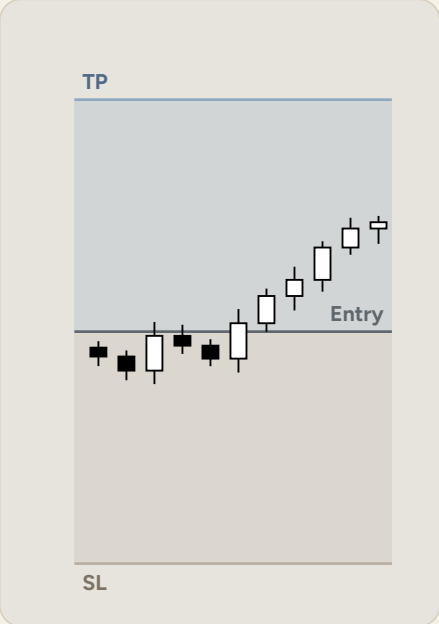

Green and red make your brain react to a trade before you have thought about it, and that is when winners get cut and stops get moved. These neutral colours make a trade heading to target and a trade heading to stop look almost the same, so you read price and levels instead of reacting to colour.

Colours

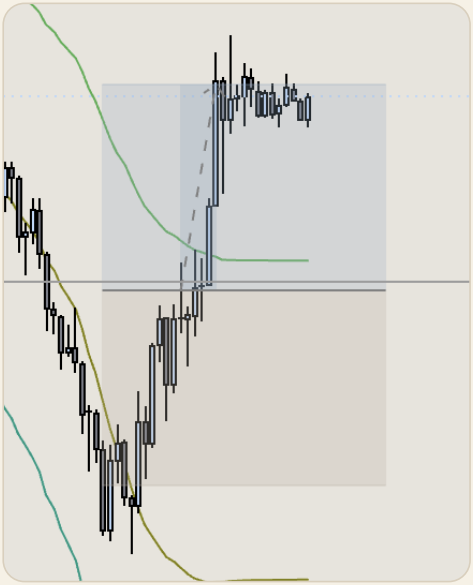

Long / Short Position tool > Style

Take profit	**#8FA8C2**	Fill 25% opacity, line and label 100%
Stop loss	**#B8AEA2**	Fill 25% opacity, line and label 100%
Entry line	**#5E676D**	100% opacity, width 1

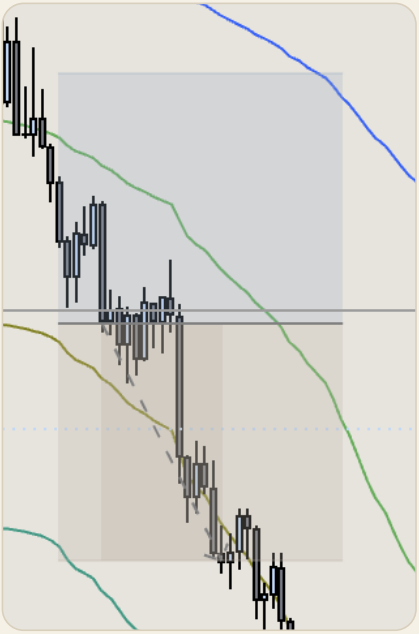

How it looks

The scheme

A winner, hitting target

A loser, hitting stop

Tips

- **Show P&L in ticks, not dollars.** Change it in your platform settings so you watch the trade, not the money.
- **Keep TP and SL away from level colours.** Red and orange are your NY and overnight levels, so a stop line should never look like one.
- **Lines at width 1.** Your POCs are width 2, so the brackets stay lighter than the levels you actually trade off.
