EXECUTION

Entries, stops, targets and managing the trade

START HERE

The Whole Trade

Every rule on one picture.

Execution is where a good read turns into a result. The rules are simple, and they're the same every time, so there's nothing left to decide once price gets to your level.

1. **Entry:** a limit order sitting at the level.
2. **Stop:** ATR × 2 points away from your entry.
3. **Target:** 1:1, the same distance as your stop.
4. **Breakeven:** once price reaches 75% of the way to your target, move your stop to your entry.
5. **Daily limit:** two losses and you're done for the day on that account.

KEY TAKEAWAY

Plan the trade before price gets there. Then let the orders do the work.

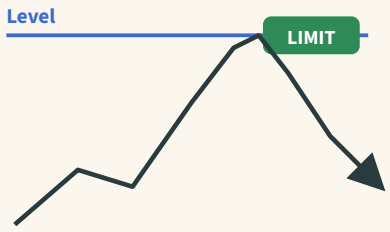

RULE 01

Entries

Limit orders, at the price you planned.

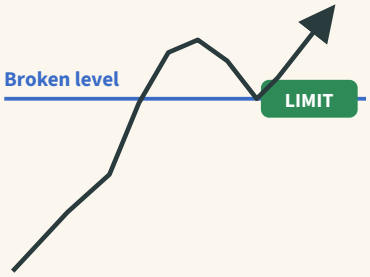

Every entry is a **limit order**. You decide the price before price gets there, and the order waits for it. No chasing, no guessing, no clicking in a panic as price flies into your level.

The Snap

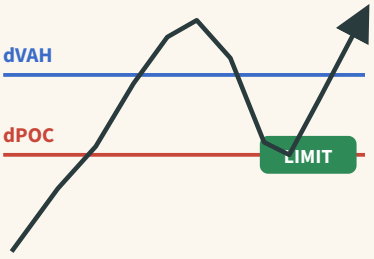

Limit at the level

The Flip

Limit on the broken level

The Magnet

Limit at the dPOC

🤌 The Snap

Limit order **at the level**. Price tags it and you're filled on the rejection.

🔄 The Flip

Limit order **on the broken level**, from the other side. Only once volume has built beyond it.

🧲 The Magnet

Limit order **at the dPOC**. Only once price has built acceptance beyond the dVAH or dVAL.

IF YOU DON'T GET FILLED

Sometimes price turns a tick before your order. You miss the trade, and that's fine. Moving your order to chase it means entering at a price you didn't plan.

RULE 02

Stops and Targets

Set by volatility, not by feel.

Stop = ATR × 2 points · Target = 1:1

Gold and Oil

Use ATR × 2 **strictly**. GC and CL often wick through a level before reacting, so the trade needs room to breathe.

NQ

Use ATR × 2 **as a guide**. NQ usually respects the level without much drawdown, so the stop doesn't need as much room.

WORKED EXAMPLE: LONG GOLD AT A LEVEL

ATR reading	2.0
Stop distance	2.0 × 2 = **4.0 points**
Entry	Limit buy at **4,000.0**
Stop	4,000.0 − 4.0 = **3,996.0**
Target	4,000.0 + 4.0 = **4,004.0** (1:1)

WHY 1:1

With a 65–70% win rate, a 1:1 target is enough. Your edge comes from how often the level holds, not from catching huge moves.

KEY TAKEAWAY

Your stop and target come from a number on your chart, never from how you feel about the trade.

RULE 03

Managing the Trade

One adjustment, then hands off.

At 75% of your target, move your stop to breakeven

Once price has travelled 75% of the way to your target, the trade has done most of its job. Moving your stop to your entry means a trade that nearly worked can't turn into a loss.

Same example	Long 4,000.0, target 4,004.0 (4.0 points)
75% of 4.0	**3.0 points**
Trigger	Price reaches **4,003.0**
New stop	Move it to **4,000.0**, your entry

Before the 75% mark, leave the stop where it is. After it, leave the trade alone until it hits your target or breakeven.

THE DAILY LIMIT

Two losses = done

Two losing trades in a day and you stop trading that account. No exceptions.

Why it matters

It keeps a bad day small and stops you trading to win it back. The next session is a clean slate.

KEY TAKEAWAY

Breakeven at 75%. Done after two losses. Everything else is just waiting.
